

Alucobond® PLUS – proven product from a trusted supplier

Whilst many of our competitors are just now undertaking testing, Alucobond® PLUS was the first ACP to undergo and pass BS8414 testing in the UK, as called up in BRE135.

More information can be found – [BRE Global](#)

Alucobond Architectural has also led the way with local fire testing, conducting the first BS8414 test on Alucobond® PLUS as prescribed in AS5113 at Exova in December 2016.

It is important to note that draft amendment to the 2016 NCC which includes AS5113 is still under review and is yet to be finalised.

The amendment to the NCC, adopting AS5113 still requires a verification method meeting A2.2 of the NCC.

Additionally, it is important to note that the current Alucobond® PLUS CodeMark Certificate (July 2017 - GM 30070) is based on several BS8414 full scale façade tests (as prescribed in AS5113), NFPA 285 and various relevant international material tests.

As a trusted worldwide brand, in addition to local fire compliance Alucobond® PLUS is also compliant to the stringent fire regulations of Europe, USA, UK, Canada and Singapore.

To re-enforce the fire safety and performance of Alucobond® PLUS, we would welcome a side by side full scale façade test involving any DtS aluminium cored composite panel as they would typically be installed on a building.

If you require any further product information, or copies of independent test results, contact our technical sales team on 1300 881 712 or click the link below to email us.
